

TF Series GUI Manual Communication Protocol AN-0028 11/18

INTRODUCTION

TF series power supplies support digital communication interface with a Host PC based on RS 232 communication protocol. The UART control interface RXD and TXD are TTL signals. These signals must be transformed to communicate with host PC by CT-2XX Communication Board. This can be acquired from SL Power Electronics. Then, the functions below can be operated:

- 1. ON / OFF control and ON / OFF Status Query.
- 2. Output voltage / current limit setting and Query.
- 3. Actual output voltage, output current and internal temperature Query.
- 4. Status of the unit Query.
- 5. Manufacturing related data Query (Include model name, serial number, MFG date etc ...).

REQUIRED HARDWARE

- 1. Host PC
- 2. CT-XXX communication board with 24-wire cable mating to C2 connector on TF power supply
- 3. USB to RS 232 adapter (with cable)
- 4. TF series power supply
- 5. Load (recommended, optional)

SW INSTALLATION

- 1. Run setup.exe file from SL-TF Installer and follow the recommended steps in SW installer tool.(Hint: The SW installer adds NI LabVIEW run-time 2011 and SL-TF_Demo Project to the system.)
- 2. If USB to RS232 adapter is used for first time, install drivers according to instructions provided with the hardware. (Hint: most likely Windows OS will recognize and install default USB drivers which are suitable for required use.)`

Follow the steps listed below to connect CT-XXX communication board to TF series power supply:

- 1. remove supplied jumper from C2 connector
- 2. connect first end of 24-wire cable to C2 connector on TF power supply
- 3. connect second end of 24-wire cable to CN1 port on CT-XXX communication board
- 4. connect USB to RS 232 Adapter to host PC.
- 5. connect USB to RS 232 to CT-XXX communication board (9 pin RS 232)
- 6. Make sure the address potentiometer is selected correctly. This is important for parallel operation of PS where two PS are not allowed to have same address.
- 7. Connect AC power cord to TF power supply
- 8. Connect load to TF power supply (recommended, optional)

CONNECTION SETUP

Follow the steps listed below to connect CT-XXX communication board to TF series power supply:

- 1. remove supplied jumper from C2 connector
- 2. connect first end of 24-wire cable to C2 connector on TF power supply
- 3. connect second end of 24-wire cable to CN1 port on CT-XXX communication board
- 4. connect USB to RS 232 Adapter to host PC.
- 5. connect USB to RS 232 to CT-XXX communication board (9 pin RS 232)
- 6. Make sure the address potentiometer is selected correctly. This is important for parallel operation of PS where two PS are not allowed to have same address.
- 7. Connect AC power cord to TF power supply

Figure 1: Connection example TF800 power supply to CT-251 communication board to RS 232 - USB adapter

- 8. Connect load to TF power supply (recommended, optional)Apply AC Power to TF power supply
 - Power supply remains in stand-by mode
 - Green LED is blinking slowly indicating power stand-by mode

FIRST RUN

- 1. Perform connection setup described in section 4.
- 2. Run SL-TF Prog_RT.exe on host PC.
- 3. Select applicable communication port before setting the program (COM7 in this example)
- 4. After selecting the applicable COM port, press SEARCH button.
- 5. ADDS0 will show power supply model voltage, output signals status and the information including DC output voltage, current and temperature)
 - ADDS0-ADDS7 are monitored in respect to potentiometer selection on TF power supply.

Figure 2: GUI, 24 V TF Series power supply connected to ADDS 0 at COM7 in local mode (green)

- 6. Change the power supply mode from Power Standby to remote mode by pressing the GLOB button from OFF to ON.
 - Orange solid LED on TF power supply is indicating power remote mode
 - Switching GLOB function off will return TF power supply to remote stand-by mode, blinking orange LED.
- 7. Click SEARCH to read and update GUI information from TF power supply.
 - Voltage indication in GUI will change its color from green to orange.
 - This indicates successful communication setup with GUI.
 - Output voltage is 0 V and output current is 0 A

Figure 3: : GUI, 24 V TF Series power supply connected to ADDS 0 at COM7 in remote mode (orange)

- 8. Set desired output voltage by entering command line: SV XX (XX for voltage value according to datasheet)
- 9. Set desired output current limit by entering command line SI YY (YY for current value according to datasheet)
- 10. Click MONITOR button for status query in continuous loop or SEARCH button for single query to readout values from TF power supply.
- 11. Get exact output voltage or current by entering command line RV? Or RI?

EXAMPLE USING A 24 VOLT MODEL

- 1. Perform connection setup described in section 4.
- 2. Run SL-TF Prog_RT.exe on host PC.
- 3. Select applicable communication port before setting the program (COM7 in this example)
- 4. After selecting the applicable COM port, press SEARCH button.
- 5. ADDS0 will show power supply model voltage, output signals status and the information including DC output voltage, current and temperature)
 - ADDS0-ADDS7 are monitored in respect to potentiometer selection on TF power supply.
